Preface **11**

I Representations 15

1 Introduction **17**
1.1 Cartesian representations . . . 17
1.2 Points in $\mathbb{E}^2$ . . . 18
1.3 Lines in $\mathbb{E}^2$ . . . 18
1.4 Points, planes and lines in $\mathbb{E}^3$ . . . 20
1.5 Basic geometric operations . . . 22
1.5.1 The line that intersects two points in $\mathbb{E}^2$ . . . 22
1.5.2 The point of intersection between two lines in $\mathbb{E}^2$ . . . 23
1.5.3 Distance between a point and a line in $\mathbb{E}^2$ . . . 24
1.6 Concluding remarks . . . 25

2 Homogeneous representations in 2D **27**
2.1 Homogeneous coordinates of 2D points . . . 28
2.1.1 P-normalization . . . 29
2.2 Dual homogeneous coordinates of 2D lines . . . 30
2.2.1 D-normalization . . . 31
2.3 Relations between points and lines . . . 32
2.3.1 The line that intersects two points . . . 32
2.3.2 The point of intersection between two lines . . . 33
2.3.3 Points on a line, or not . . . 33
2.3.4 Lines through a point, or not . . . 35
2.4 Operations on normalized homogeneous coordinates . . . 35
2.4.1 Distance between two points . . . 36
2.4.2 Distance between a point and a line . . . 36
2.4.3 Area of a triangle . . . 38
2.4.4 Concluding remarks . . . 40
2.5 Points and lines at infinity . . . 41
2.5.1 Points at infinity . . . 41
2.5.2 The line at infinity . . . 43
2.6 Parametric representations of lines . . . 44
2.7 Plücker coordinates . . . 46
2.8 The duality principle in $\mathbb{E}^2$ . . . 47

3 Transformations in 2D **49**
3.1 How to characterize a transformation . . . 49
3.1.1 Degrees of freedom . . . 49
3.2 Rigid transformations . . . 50
3.3 Similarity transformations . . . 54

3.4 Affine transformations . . . 55
3.4.1 Non-uniform scaling . . . 56
3.4.2 Reflection . . . 57
3.4.3 Shearing . . . 58
3.4.4 Decomposition of an affine transformation . . . 59
3.5 Dual transformations . . . 59
3.5.1 Geometric characterization of affine transformations . . . 60
3.6 Projections . . . 61
3.7 Concluding remarks . . . 62

4 Homogeneous representations in 3D **63**
4.1 Homogeneous coordinates of 3D points . . . 63
4.2 Dual homogeneous coordinates of 3D planes . . . 64
4.2.1 Parametric representation of a plane . . . 65
4.3 Homogeneous representations of 3D lines . . . 66
4.3.1 Parametric representation of a 3D line . . . 66
4.3.2 Plücker coordinates of 3D lines . . . 67
4.3.3 L-normalization . . . 67
4.3.4 Dual Plücker coordinates . . . 69
4.3.5 The duality mapping . . . 70
4.3.6 Internal constraint and degrees of freedom . . . 70
4.3.7 DL-normalization . . . 71
4.4 Incidence relations between points, planes, and lines . . . 71
4.4.1 The intersection of a line with a plane . . . 72
4.4.2 The plane that intersects a line and a point . . . 72
4.4.3 The point that intersects three planes . . . 73
4.4.4 The plane that intersects three points . . . 74
4.4.5 Points on a plane, or not . . . 75
4.4.6 Planes through a point, or not . . . 76
4.4.7 The intersection of two lines . . . 76
4.5 Distances . . . 77
4.5.1 Distance between two points . . . 77
4.5.2 Signed distance between a point and a plane . . . 77
4.5.3 Distance between a point and a line . . . 77
4.6 The duality principle in $\mathbb{E}^3$ . . . 78

5 Transformations in 3D **79**
5.1 Degrees of freedom . . . 79
5.2 Rigid transformations . . . 79
5.3 Similarity transformations . . . 80
5.4 Affine transformations . . . 80
5.5 Dual transformations . . . 82
5.6 Line transformations . . . 82

6 Homographies **83**
6.1 Homographies in 2D . . . 83
6.1.1 Applications of homographies . . . 86
6.1.2 Points at infinity revisited . . . 86
6.2 Homographies in 3D . . . 87
6.3 Canonical homogeneous coordinates . . . 88
6.3.1 Canonical homogeneous coordinates in 2D . . . 88
6.3.2 Canonical homogeneous coordinates in 3D . . . 88
6.3.3 Concluding remarks . . . 89

7 The pinhole camera **91**
7.1 Central projection . . . 91
7.1.1 Camera obscura . . . 93
7.2 Camera centered coordinate systems . . . 94
7.2.1 The normalized camera . . . 97
7.3 The general pinhole camera . . . 101
7.3.1 Camera transformations . . . 101
7.3.2 The camera at infinity . . . 103
7.3.3 Internal and external camera parameters . . . 103
7.3.4 Camera resectioning . . . 106
7.4 The digital image . . . 108
7.5 The geometry of a pinhole camera . . . 111
7.5.1 Projection lines . . . 111
7.5.2 Equivalent cameras . . . 112
7.5.3 Images of a plane . . . 114
7.5.4 The image of a line . . . 115
7.5.5 Projection planes . . . 116
7.5.6 Camera projection constraints . . . 117
7.5.7 Geometric interpretation of **C** . . . 117
7.5.8 Field of view . . . 118

8 Epipolar geometry **121**
8.1 Stereo cameras . . . 123
8.1.1 Epipolar points . . . 123
8.1.2 Epipolar lines . . . 124
8.1.3 Epipolar planes . . . 124
8.1.4 Epipolar homographies . . . 126
8.2 The fundamental matrix . . . 127
8.2.1 The epipolar constraint . . . 127
8.2.2 The fundamental matrix . . . 127
8.2.3 Symmetry . . . 128
8.2.4 Invariance to homography transformations of 3D space . . . 129
8.2.5 Transformations of the image coordinates . . . 130
8.2.6 Parameterization of **F** . . . 130
8.2.7 Camera matrices from **F** . . . 131
8.2.8 Summary of properties related to **F** . . . 133
8.2.9 The epipolar constraint in practice . . . 133
8.3 Triangulation . . . 134
8.3.1 Ambiguities of the world coordinate system . . . 135
8.4 Stereo rectification . . . 136
8.4.1 Rectified stereo rig . . . 136
8.4.2 Rectification of stereo images . . . 138
8.4.3 The Loop and Zhang rectification method . . . 138
8.5 Calibrated epipolar geometry . . . 138
8.5.1 Normalized stereo cameras . . . 139
8.5.2 The essential matrix . . . 139
8.5.3 Camera poses from **E** . . . 141
8.5.4 Transformations of the image coordinates . . . 143
8.5.5 Minimal parameterization of **E** . . . 144
8.5.6 Summary of properties related to **E** . . . 144

9 Representations of 3D rotations **147**
9.1 Rotation matrices . . . 148
9.1.1 Representations of $SO(3)$ . . . 149
9.2 Axis-angle representation . . . 150
9.2.1 Rodrigues' rotation formula . . . 151
9.2.2 Axis-angle from $SO(3)$ . . . 153
9.2.3 Summary . . . 154
9.3 so(3) . . . 154
9.3.1 Using the matrix exponential function . . . 154
9.3.2 The Cayley transform . . . 156
9.3.3 Summary . . . 157
9.4 Unit quaternions . . . 158
9.4.1 The quaternionic embedding of $SO(3)$ . . . 159
9.4.2 **R** from unit quaternion . . . 160
9.4.3 Unit quaternion from **R** . . . 160
9.4.4 Relation to the Cayley representation . . . 161
9.4.5 Summary . . . 162
9.5 Three-angle representations . . . 162
9.5.1 Finding the Euler angles for **R** . . . 163
9.5.2 Summary . . . 164
9.6 Which representation do I choose? . . . 165
9.7 Related topics . . . 166
9.7.1 Twisted rotations . . . 166
9.7.2 Gimbal lock . . . 169

II Estimation **171**

10 Introduction to estimation **173**
10.1 Least squares formulation . . . 173
10.2 Total least squares formulation . . . 176
10.3 Geometric errors . . . 178
10.4 Algebraic errors . . . 179
10.4.1 The inhomogeneous method . . . 181
10.4.2 The homogeneous method . . . 182
10.5 What causes the errors? (Part I) . . . 183
10.5.1 Model errors . . . 184
10.5.2 Data errors . . . 185
10.6 Maximum likelihood estimation . . . 188

11 Estimation of transformations **191**
11.1 Homography estimation . . . 191
11.1.1 Geometric errors . . . 191
11.1.2 Direct Linear Transformation (DLT) . . . 192
11.1.3 The correspondence problem . . . 194
11.1.4 Minimal case estimation . . . 196
11.1.5 Degeneracies . . . 197
11.2 The homogeneous method revisited . . . 198
11.2.1 SVD profile . . . 198
11.2.2 Data normalization . . . 200
11.2.3 SVD profile, again . . . 207
11.2.4 Closing remarks . . . 209
11.3 Camera matrix estimation . . . 210

12 Non-linear estimation **215**
12.1 Non-linear estimation techniques . . . 215
12.1.1 Initial solutions . . . 216
12.1.2 Parameterizations . . . 216
12.2 Re-parameterization . . . 219
12.2.1 An example . . . 220
12.3 The residual . . . 221
12.3.1 Re-mapping of the residual . . . 221
12.3.2 Choosing residual . . . 222
12.4 An example: estimation of a line . . . 224
12.4.1 Using a homogeneous representation as parameters . . . 225
12.4.2 Minimal parameterizations . . . 226
12.5 An example: estimation of a homography . . . 228

13 Estimation involving rotations **231**
13.1 Estimation of 3D rotations . . . 232
13.1.1 Using OPP . . . 232
13.1.2 Using SOPP . . . 233
13.1.3 Using quaternions . . . 233
13.1.4 OK, so which algorithm do I choose? . . . 234
13.2 Estimation of rigid transformations . . . 235
13.2.1 Iterative Closest Point (ICP) . . . 236
13.3 Non-linear least squares estimation involving rotations . . . 237
13.3.1 Quaternions . . . 238
13.3.2 Axis-angle representation . . . 239
13.3.3 Euler angles . . . 241
13.4 The Perspective *n*-Point Problem (P*n*P) . . . 241
13.4.1 Algebraic estimation . . . 242
13.4.2 Geometric minimization . . . 243
13.4.3 Minimal case estimation (P3P) . . . 244

14 Estimation of epipolar geometry **245**
14.1 Triangulation . . . 245
14.1.1 The mid-point method . . . 245
14.1.2 Algebraic methods . . . 247
14.1.3 Optimal triangulation . . . 247
14.1.4 Closing remarks . . . 250
14.2 Estimation of **F** . . . 252
14.2.1 The 8-point algorithm . . . 252
14.2.2 The 7-point algorithm . . . 255
14.2.3 Degeneracies . . . 255
14.2.4 Minimization of geometric errors . . . 257
14.3 Estimation of **E** . . . 259
14.3.1 Algebraic estimation . . . 259
14.3.2 Minimal case estimation of **E** . . . 260

15 Robust estimation **261**
15.1 What causes the errors? (Part II) . . . 262
15.1.1 Inliers and outliers . . . 262
15.2 Robust errors . . . 263
15.3 RANSAC . . . 264
15.3.1 An indeterministic approach . . . 265
15.3.2 Robust estimation of a 2D line . . . 266
15.3.3 Probabilities and number of trials . . . 268
15.3.4 Variants of the basic RANSAC algorithm . . . 268

15.4 Revisiting the correspondence problem . . . 269
15.4.1 RANSAC and the correspondence problem . . . 269
15.4.2 Preprocessing of data . . . 270
15.4.3 Closing remarks . . . 272
15.5 Robust estimation in practice . . . 272
15.5.1 Robust estimation of **H** . . . 272
15.5.2 Robust estimation of **F** . . . 273
15.5.3 Robust estimation of **E** . . . 274
15.5.4 Robust P*n*P . . . 276

III Applications **277**

16 Camera calibration **279**
16.1 Automatic camera calibration . . . 280
16.1.1 Mathematical foundation . . . 280
16.1.2 Geometric errors . . . 282
16.2 Lens distortion . . . 282
16.2.1 Radial lens distortion . . . 284
16.2.2 General distortion models . . . 287
16.2.3 General coordinate systems . . . 287
16.2.4 OK, so which distortion model do I choose? . . . 288
16.2.5 Calibration of lens distortion . . . 288
16.2.6 Compensating for the lens distortion . . . 289
16.3 Zhang's calibration method . . . 290
16.3.1 Geometric errors . . . 292
16.3.2 Lens distortion . . . 293
16.3.3 Summary . . . 293

17 Image mosaics **295**
17.1 Introduction . . . 295
17.2 Using homographies . . . 297
17.2.1 A mosaic from two images . . . 297
17.2.2 Blending . . . 302
17.2.3 A mosaic from several images . . . 304
17.3 Using spherical coordinates for panoramas . . . 306
17.3.1 A panorama from two images . . . 308

18 Structure from motion **313**
18.1 Reconstruction from normalized cameras . . . 315
18.1.1 Accumulative reconstruction from triplets of normalized cameras . . . 315
18.2 Bundle adjustment . . . 317
18.3 Incremental bundle adjustment . . . 318
18.3.1 Initialization . . . 318
18.3.2 Adding a camera . . . 319
18.4 Practical issues . . . 322
18.4.1 Parameterization of the camera poses . . . 322
18.4.2 Flexible scheme for adding cameras . . . 324
18.4.3 The residual vector **r** . . . 324
18.4.4 Sparsity of **J** . . . 324
18.4.5 The Schur complement trick . . . 325
18.5 Further reading . . . 326

IV Toolbox **327**

A Spaces **329**
A.1 Projective spaces . . . 329
A.1.1 Construction of a projective space . . . 329
A.1.2 Operations on projective spaces . . . 330
A.1.3 Concluding remarks . . . 331
A.2 Quaternions . . . 332
A.2.1 Vector+scalar notation of quaternions . . . 333

B Matrices **335**
B.1 Cross product operator . . . 335
B.2 Matrix pseudo-inverse . . . 337
B.2.1 Non-uniqueness of the matrix pseudo-inverse . . . 338
B.2.2 Pseudo-inverse of a transformed matrix . . . 338
B.3 Block matrices . . . 339
B.3.1 Block matrix multiplication . . . 339
B.3.2 Block diagonal matrix . . . 340
B.3.3 Inverse of a block diagonal matrix . . . 340
B.3.4 Blockwise matrix inverse . . . 340
B.4 Singular value decomposition (SVD) . . . 340
B.4.1 Theorem . . . 341
B.4.2 Relation between EVD and SVD . . . 342
B.4.3 Outline of existence proof . . . 342
B.4.4 Applications of SVD . . . 342
B.4.5 The orthogonal Procrustes problem . . . 345
B.4.6 Computation of SVD . . . 346
B.4.7 Special SVD (SSVD) . . . 347
B.5 Perturbation analysis . . . 347
B.5.1 The Eckart-Young theorem . . . 347
B.5.2 Perturbation of the eigensystem of a symmetric matrix . . . 348
B.6 Functions on matrices . . . 349
B.6.1 Matrix power . . . 350
B.6.2 Matrix exponential function . . . 350
B.6.3 Matrix logarithm . . . 351
B.7 Generalizations of the spectral theorem . . . 351
B.7.1 To $so(n)$ . . . 351
B.7.2 To $so(3)$ . . . 353
B.7.3 To $SO(n)$ . . . 354
B.7.4 To $SO(3)$ . . . 355
B.8 QR-factorization . . . 355
B.8.1 Special QR-factorization . . . 356
B.8.2 QR-factorization of $3 \times n$ matrices . . . 356

C Non-linear optimization **359**
C.1 General methods . . . 360
C.1.1 Steepest descent . . . 360
C.1.2 Newton's method . . . 362
C.2 Non-linear least squares problems . . . 363
C.2.1 The Gauss-Newton method . . . 363
C.2.2 The Levenberg-Marquardt method . . . 364
C.2.3 Without the Hessian approximation . . . 365
C.3 Stop criteria . . . 366
C.4 OK, so which method do I choose? . . . 366
C.5 Practical issues . . . 367

C.5.1 Computing the Jacobian 367
C.5.2 Sparse Jacobian 368
C.5.3 Inverting $\mathbf{J}^\top\mathbf{J}$ 368
